Title : Test of the Muromtsev-Tronin Semiliquid
Vaccine in Conditions of Kirgizia

Orig Pub : V ls.: Brucellev s-kh. zhivotnykh, M.
Sel'khozgiz, 1955, 161-169

Abstract : The semiliquid Muromtsev-Tronin bruce-
llosis formolvaccine tested in a number
of farms of Kirgizia: favorable to bru-
cellosis was found to possess the ability
to hasten the recovery of the animals.
Fully grown sheep repeatedly vaccinated
reacted allergically to brucellisate

Abstract : with the number of animals that reacted being in direct proportion to the number of animals vaccinated. The allergic reaction completely disappeared in the majority of the cases at the beginning of the subsequent cycle of vaccination. Young stock after one cycle of vaccination did not react to allergen as a rule. Fully grown cattle following a single cycle of vaccination reacted with an agglutination reaction (RA) for a period of four to six months. In animals which were subjected to revaccination for a number of years the RA was preserved in

Abstract : doubtful and sometimes in positive
titers for a period of ten to twelve
months, and in some animals even for
longer periods of time. The semiliquid
formol vaccine was harmless to cows in the
final stages of pregnancy. Complications
from the application of the vaccine to
pregnant sheep were noted only on one
farm where the sheep were vaccinated for
the third time during the second half
of the pregnancy period and under condi-
tions of a severe winter.

TITLE: Surveyors activity at the erection of a rolling mill track

SOURCE: Geodeticky a kartograficky obzor, no. 1, 1966, 17-20

TOPIC TAGS: general construction, rolling mill, cold rolling, sheet metal, geodetic survey

ABSTRACT: The author describes geodesic activity of the surveyors during an erection of a thin iron sheet cold rolling mill at the Iron Works of Eastern Slovakia. The plant was built by the Czech factory Skoda of Plzen, who designed it according to a basic Russian design. The rolling mill receives sheets 500 - 1020 mm wide and 1.8 to 4.5 mm thick and produces sheets with a thickness of 0.18 to 1mm, 500 - 1020 mm wide. Rolling pressures reach up to 1800 tons, and the rolling speed is 35 m/sec. The geodesic activity consisted of the exact determination of elevations of individual rollers, and an exact determination of elevations of individual points; making sure that the equipment was erected at exactly the planned position; finding of movements and of deformations; control of the maintaining of the equipment in the planned position during erection and start-up operations. This paper was presented by Engineer Candidate of Sciences Miroslav Herda, UGK, Prague. Orig. art. has 4 figures. [JPRS]

TITLE: Direct method of measuring the elastic recovery of imprints
on transparent materials in microhardness tests

PERIODICAL: Zavodskaya laboratoriya, v. 28, no. 12, 1962, 1494 - 1495

TEXT: For this purpose the authors developed and constructed a device for applying test loads to the diamond indenter mounted on the support of a metallographic microscope, type MIM-7 (MIM-7). The device consists of a diamond pyramid which, under a specific load, can be indented into a sample of transparent material placed on the microscope stage. The pyramid can be adjusted vertically and focused in the center of the field of view. The elastic recovery is ascertained by measuring the imprint first under the test load, i.e. when the pyramid has been lowered correspondingly, and then when the same has been lifted. In specific measurements carried out on glass specimens, the following test values were measured or calculated: b_0 , the dimension of the unrecovered imprint side; b , the dimension of the recovered imprint side; $\Delta b_0 = b_0 - b$, the elastic recovery of the imprint

Card 1/2

Direct method of measuring the...

S/032/62/028/012/014/023
B126/B186

side. To reduce errors in measurement it is recommended that the imprint measurements should be numerous. The number of imprints n that have the same b_0 depends on Δb_0 . If the dependence of n on Δb_0 is plotted, the peak value of n can be read off the curve and corresponds to the most probable value of elastic recovery. For example, an elastic recovery of 3.8μ was obtained for a specimen with $b_0 = 17.3\mu$. For glass specimens with $b_0 = 11 - 17\mu$, Δb_0 values of 1.9 ± 0.3 to $3.0 \pm 0.4\mu$ were obtained. In addition, the device can be used for measuring the microhardness of transparent materials, as the lowering of the pyramid to the surface of the sample is easy to observe and exact setting in vertical direction is possible. Thus it is possible to measure very small imprints with no extra load applied. There are 2 figures and 1 table.

TITLE: Distribution of the dislocations in the neighborhood of
notches in NaCl and LiF single crystals

PERIODICAL: Fizika tverdogo tela, v. 5, no. 2, 1963, 518-523

TEXT: A study was made of the dislocation distributions in the neighborhood of notches that had been applied to the (001) planes of NaCl and LiF single crystals in the [100] and [110] directions by means of a diamond pyramid. For this purpose selective etching was employed. The NaCl crystals were etched with solutions of CdCl_2 in ethyl alcohol, the LiF crystals with solutions of FeCl_3 in ethyl alcohol. Results: Dislocation regions are formed on the (001) planes of both single crystals as a result of the application of the notches. Although the width of the notches that were obtained by applying a certain load to the diamond becomes wider when they had the [100] direction than when they had the [110] direction, the width of the dislocation regions in the former was Card 1/2

Distribution of the dislocations ...

S/181/63/005/002/021/051
B104/B102

narrower than that of the latter. "Beards" of two series of loop dislocations are formed around the notches lying in the $[110]$ direction. There are 4 figures and 2 tables.

TITLE: On the nature of the anisotropy of the hardness of alkali-halide crystals

SOURCE: AN MoldSSR. Institut prikladnoy fiziki. Teoreticheskiye i eksperimental'nyye issledovaniya fizicheskikh svoystv poluprovodnikovyykh materialov i drugikh kristallov (Theoretical and experimental studies on physical properties of semiconductor materials and other crystals). Kishinev, Izd-vo Kartya Moldovenyashke, 1965, 76-84

TOPIC TAGS: alkali halide, crystal dislocation phenomenon, sodium chloride, hardness, crystal surface

ABSTRACT: The authors report investigations of the distribution of dislocations around scratches made on the face (001) of NaCl in the directions [100] and [110] for the purpose of determining the planes along which slipping develops as a result of scratches in these directions. The dislocation distribution was investigated by selective etching. The scratches were produced by a standard diamond pyramid of the PMT-3 instrument. The load on the pyramid ranged from 0.5 to 5 grams. The techniques used for the distribution of the dislocations around the scratches are described in some detail. All the methods yielded similar results. It is concluded that when the scratches are produced along the [100] direction, the slip develops essentially along the planes (011) and (011). When the scratches are made along [110], the slip occurs

Card 1/2

ACC NR: AT6024012

essentially on the (110) plane. Scratches along [100] produce a dislocation distribution similar to that obtained by striking a ball against the (001) face. The difference in hardness in the two directions is explained on the basis of the relative ease with which the slip planes are formed. Orig. art. has: 9 figures and 1 table.

TITLE: Revealing of dislocations and dislocation structure arising from the deformation of gallium phosphide single crystals

SOURCE: Fizika tverdogo tela, v. 8, no. 8, 1966, 2475-2477

TOPIC TAGS: gallium compound, phosphide, crystal dislocation, crystal deformation

ABSTRACT: The action of several etchants recommended in the literature for revealing dislocations on the (111) growth face of gallium phosphide single crystals is compared and it is shown that only etchant No. 3 (boiling solution of 27 g FeCl_3 , 250 ml HCl and 350 ml water) reveals true dislocation etch pits. This was confirmed by observations of etch patterns formed on the (111) surface after its deformation with a diamond indenter and with scratches along definite crystallographic directions. The dislocation rosettes obtained around the indentations consisted of six rays along the $\langle 110 \rangle$ directions. The shape of these rosettes did not show any polarity of the $\langle 112 \rangle$ directions. This feature distinguishes the crystals studied from cubic crystals with another lattice type, e. g., alkali halide crystals. In the latter, a concentrated force on the (111) face produces a three-ray dislocation rosette whose shape definite-

Card 1/2

-4. 00433-67

ACC NR: M026710

ly indicates the polarity of the $\langle 11\bar{2} \rangle$ directions. One of the possible causes of this difference is probably the fact that in gallium phosphide the glide takes place on planes of a different type than in alkali halide crystals. The distribution of dislocations around the scratches clearly reflects the polarity of the $\langle 11\bar{2} \rangle$ directions. In conclusion, the authors thank S. L. Pyshkin and Yu. I. Maksimov for providing the gallium phosphide single crystals. Orig. art. has: 2 figures.

~~Time to inspect video frame.~~

6. The first frame of the video shows a person in a dark uniform, possibly a soldier, standing in a field. The person is facing away from the camera, looking towards a line of trees in the distance. The ground appears to be uneven and possibly covered in grass or low-lying vegetation. The lighting is somewhat dim, suggesting it might be early morning or late afternoon. The overall scene is somewhat blurry, typical of older video footage.

Title : A Statistical Investigation of Sugar Determination by
Comparison.

Orig Pub : Cukoripar, 1958, 11, No 2, 27-31.

Abstract : A sugar determination by comparison was carried out by
two individuals, each one of whom conducted calculations
by two methods. On the average, the error of a subjecti-
ve nature diverged less in the results, obtained by the
same person, using different calculating methods. Even
greater divergences are observed at the evaluation of the
"utfel's" [Utfel - from the German Hut-Fuelle, a semi-
finished product obtained by boiling sugar syrup in a
vacuum apparatus until a definite concentration of the

solid substance is reached. The German name is explained by the fact that originally this product was poured into cone-shaped molds. / quantity in vacuum apparatuses. In daily determinations of sugars by comparison, a part of the production is not taken into an account, which, however, is later on detected, and one may indicate the above-normal losses only at a deficit balance of several days' duration in succession. -- G. Yudkovich.

AUTHORS: Didenko, A. N. and Vall, A. N.

TITLE: Use of the Kramers method for calculating the particle loss
in cyclotrons due to the effect of scattering on betatron
oscillations

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 7, 1961, 830-833

TEXT: The authors show that the Kramers method, developed for investi-
gating the passage of Brown's particles through a potential barrier, is
also suitable for the determination of the portion of lost particles which
develops through scattering on betatron oscillations. Kramers method may
be applied if the particle loss sets in as a consequence of stochastic
forces affecting processes which differ in their physical nature provided
that the focusing forces can be described by a potential function of finite
height. Since the potential functions describing the phase oscillations in
synchrotrons meet these requirements, there is no doubt as to the applica-
bility of Kramers' method for calculating the particle loss caused by

Card 1/7

Use of the Kramers method for ...

energy losses. For the potential function of the betatron oscillations B. N. Rodimov (Trudy TPI, 87, 3, 1957) obtained expression

$$V_{MO} = \left(\sqrt{V_{MO}} + \frac{C}{r} \sqrt{\frac{a}{2mc^2}} \right)^2 \quad (2)$$

which is correct for the nonrelativistic case. $C = \frac{cm}{e} r_0^2 \theta_0 - r_0 A$ is the integration constant and A_0 the vector potential of the outer magnetic field. In addition, $V_{MO} = V_{MC} |_{C=0}$:

$$V_{MO} = \frac{\beta E^2}{2em_0 c^2} \operatorname{ch}^2 \left(\sqrt{n_0} \frac{r}{R_0} \right) \left[N_1' \left(\sqrt{n_0} \right) J_1 \left(\sqrt{n_0} \frac{r}{R_0} \right) - \right. \\ \left. - J_1 \left(\sqrt{n_0} \right) N_1 \left(\sqrt{n_0} \frac{r}{R_0} \right) \right] \quad (3)$$

Card 2/7

Use of the Kramers method for ...

S/057/61/031/007/011/021
B104/B206

holds. J_1 and N_1 are the Bessel- and Newman functions, E the particle energy, R_0 the equilibrium radius, n_0 the weakening coefficient of the magnetic field for $r = R_0$, $\beta = v/c$. For the relativistic case, P. A. Cherdantsev (Trudy TPI, 87, 48, 1957) found

$$V = \left[\frac{m_0^2 c^4}{e^2} + \left(V_{M0} + \frac{C}{r} \right)^2 \right]^{1/2} - \frac{m_0 c^2}{e}, \quad (4)$$

where

$$V_{M0} = \frac{\beta E}{e} \left[N_1'(\sqrt{n_0}) J_1(\sqrt{n_0} \frac{r}{R_0}) - J_1'(\sqrt{n_0}) N_1(\sqrt{n_0} \frac{r}{R_0}) \right] \text{ch}(\sqrt{n_0} \frac{z}{R_0}). \quad (5)$$

From an analysis of the stability range of the betatron oscillations it

Card 3/7

Use of the Kramers method for ...

S/057/61/031/007/011/021
B104/B206

may be concluded that the Kramers method is applicable for the particle loss due to elastic scattering from the radial betatron oscillations, since the potential function of the betatron oscillations in radial direction has the form of the potential function of an anharmonic oscillator and, thus, a well defined height. With the formula $\frac{1}{N} \frac{dN}{dt} = -\gamma \frac{\Delta U}{U_{exc}} \exp(-\Delta U/U_{exc})$ (6)

the authors calculated the shares of the lost particles in the case of δ -shaped ($C = 0$) and uniform ($C \neq 0$) distribution of the particles over the chamber cross section. The calculations were made for various μ values; μ was calculated by

$$\mu = 0.0609091 \frac{(m_{00}^2)^2}{E_{ann.}} 1.25 \cdot 10^{-3} E_e \times \\ \times \left(\frac{R}{2\sqrt{q} a_0} \right)^2 2\pi \frac{1}{\Delta E}. \quad (A)$$

Card 4/7

Use of the Kramers method for ...

S/057/61/031/007/011/021
B104/B206

$\eta = E / E$ is the attenuation coefficient, $\Delta U/e = (V_{\max} - V_{\min})$ the height of the potential barrier, $U_{\text{exc}} = m\bar{x}^2/2$ the excitation energy, and \bar{x}^2 the square of the mean scattering of the radial velocity, which may be determined according to A. N. Matveyev (Doktorskaya dissertatsiya, MGU, 1959). Figs. 1 and 2 show the results graphically. The dashed lines were obtained according to Matveyev. From a comparison of the results it may be seen that the passage of particles does not exceed 5-10% in the practically important pressure range ($< 5 \cdot 10^{-5}$ mm Hg). The authors thank Professor Doctor A. A. Vorob'yev for his interest. There are 2 figures and 6 references: 4 Soviet-bloc and 2 non-Soviet-bloc.

Abstract: Technical and physico-chemical indices are given,
fractions produced at the industrial, shale-pro-
cessing installations. Optimal limits of fraction
cuts, are determined, in industrial distillation,

on the basis of characteristics of distillates and distillation residues. Quality indices of fractions obtained on using different distillation processes permit to determine the advisability of carrying out atmospheric or vacuum distillation, in each specific instance. Curves are shown by means of which the corresponding drop-point temperature is determined for different amounts of residue.

AUTHORS: Fayngold, S.I., Candidate of Technical Sciences, and Vallas, K.R.

TITLE: Some Data on Cracking Generator Pitch with Zinc Chloride (Nekotoryye dannyye o krekinge generatornoy smoly s khloristym tsinkom)

PERIODICAL: Izvestiya Akademii Nauk Estonskoy SSR, Seriya Tekhnicheskikh i Fiziko-Matematicheskikh Nauk, 1957, #3, pp 245-252 (USSR).

ABSTRACT: During the current 5-Year Plan, it is planned to increase the output of generator gas obtained from oil shale, which will also result in increased generator pitch output. Generator pitch has not as yet been used rationally and served mostly as fuel mazut.

Catalyzers and operational methods used for oil cracking cannot be applied for cracking of shale pitch. It is expedient to carry out the latter with such catalyzers which further hydrogen re-distribution and at the same time remove oxygen compounds without formation of water. Zinc chloride can serve as such a catalyzer. Therefore, the cracking process of shale pitch

TITLE:

Some Data on Cracking Generator Pitch with Zinc Chloride (Nekotoryye dannyye o krekinge generatornoy smoly s khloristym tsinkom)

with zinc chloride as a catalyzer was studied in detail.

The following conclusions were drawn from this investigation:

1. $ZnCl_2$ can be applied for production of light motor fuel out of shale pitch;
2. Cracking of shale pitch with $ZnCl_2$ begins at temperatures 230 to 250°C and proceeds intensively at temperatures above 400 to 425°C;
3. More than 30 % of gasoline is obtained from the fraction of generator pitch which boils away at temperatures below 325°; the quality of this gasoline exceeds that of shale gasoline purified with sulfuric acid;
4. Formation of water is not observed when cracking with zinc chloride. Re-distribution of hydrogen and aromatization of the products occurs.

The article contains 2 graphs and 6 tables. There are 18 references, 15 of which are Slavic.

REF SOURCE: Tr. Tallinsk. politekhn. in-ta, v. A, no. 214, 1964, 79-89

TOPIC TAGS: magnetic field, magnetic field measurement

TRANSLATION: A study was made of a magnetic field created in the air by a current flowing along an infinitely thin rectilinear conductor of finite length. Practical procedures are proposed for calculating magnetic induction in a fixed point, as well as straight along, parallel to, or crossing the conductor. The magnetic field of a rectangular circuit considered to be approximately coinciding with the magnetic field of the rectangular coil is also calculated. Illustrations 8, references 3. TOPIC TAGS: magnetic field, magnetic induction

ABSTRACT: The method of calculation is based on a previously published method for determining the field of a single-phase winding. Thus, the article starts with a mathematical development of the magnetic field of a single-phase winding. The results of the theoretical calculations are shown in a series of curves. The authors then pass on to the extension of the method to the three-phase case. The theoretical conclusions were checked by experiments on a three phase inductor with a two layer diametral winding. Experimental results, shown graphically, agree satisfactorily with theory. In addition, tests were carried out on the magnetic induction along the length of the magneto. It was found that, over three quarters of the length of the magneto the

TITLE: Experimental results obtained on the first electroslag furnace built in France according to a Soviet license

SOURCE: Stal'. no. 2, 1966, 135-139

TOPIC TAGS: steel alloy, steel industry, steel microstructure, steel impurity, austenitic steel

ABSTRACT: The performance of the first Soviet-built electroslag steel furnace in France is described. The performance of the furnace was tested on a number of alloy and austenitic steels. The chemical composition, the usual mechanical properties, microstructure, and the distribution of nonmetallic impurities in the steel ingots were determined. The experimental results are presented in graphs and tables (see Fig. 1). It is concluded from the experimental results that the furnace performance was highly satisfactory and that the electroslag method of steel smelting seems to be very promising indeed. 4
